SQL Audit

How does SQL Audit help IT Departments?

SQL Auditing is a great product for all companies. All IT departments manage, modify and display information in databases. Regulatory compliance and internal controls go to the heart of IT with requirements to manage & track this activity.

Combined with SQL/Pro Authority controls, which offer extensive tailoring on the access of all files and tailoring of the functionality within SQL/Pro for each user, SQL Audit features create the tracking and reporting mechanisms required for IT audits. Finally, SQL audit files can easily be protected from misuse and special security needs can be hand-tailored as needed by appropriate users.
